Email: 0xscater@gmail.com

Twitter/X: [0xscater](#)

Portfolio: block-programr.github.io

ABOUT

Competitive smart contract auditor with strong experience in Defi security.

Active participant in audit contests and blockchain and crypto CTFs, building deep understanding of protocol design, edge cases, and attack vectors.

Experienced in manual code reviews, fuzz testing, and static analysis on EVM-based protocols.

Develop low-level security tools for EVM and Solana ecosystems.

Portfolio audits and projects: block-programr.github.io

EDUCATION

Rajiv Gandhi University of Knowledge Technologies (RGUKT), Nuzvid

Expected 2027

- Bachelor of Technology in Computer Science & Engineering - GPA: 8.6/10 (overall)

EXPERIENCE

QuillAudits (FeistelBlock Technology)

Remote

Web3 Security Triager and Auditor

May 2026 - Present

- Triaging smart contract vulnerability reports submitted by security researchers
- Reviewing and validating severity classifications across EVM-based DeFi protocols
- Collaborating with the audit team to ensure accurate, high-quality security assessments

Competitive Smart Contract Auditor

Remote

Code4rena, Cantina, Sherlock

2025 - Present

- **Revert Protocol (Cantina)**: Secured **1st Place** in the contest ([cantina](#))
- **Intuition Protocol (Code4rena)**: Secured **2nd Place** and recognized as a **Top Gatherer**. Identified **Medium-risk vulnerability**. Awarded **\$445.93**
- **Ekubo Protocol (Code4rena)**: Secured **1st Place** in Quality Assurance (QA). Awarded **\$1,515** for comprehensive report quality and edge-case coverage
- **Kuru Protocol (Cantina)**: Identified a confirmed **High-Severity** vulnerability involving complex state inconsistencies. Awarded **\$605**
- **Megaprot Protocol (Code4rena)**: Secured **16th Rank** globally in the contest (\$177 reward)
- Utilize hybrid methodology: Manual review + Fuzzing (Foundry/Echidna) + Static Analysis (Slither)

Team HackerTroupe

Remote

CTF Player - Blockchain Security

Ongoing

- Actively participating in global CTFs across blockchain and crypto categories
- Global Rank **#56** in Blitz CTF 2025 (Blockchain Security)
- Rank **#13** in CyberTEA 3.0 (National Level CTF by IIIT Sri City)
- Rank **#20** in HackerGambit 2025 (National Level CTF)
- Regularly solve challenges on Ethernaut, Damn Vulnerable DeFi, and Capture the Ether

PROJECTS

KavachPay — Private Payroll Protocol on Solana [\[Link\]](#)

2026

- Tech: Solana, Anchor, Rust, TypeScript, Next.js, MagicBlock Private ER, Intel TDX, TailwindCSS
- Built a privacy-first payroll protocol using MagicBlock Private Ephemeral Rollups (TEE) to hide salary amounts, recipients, and memos on-chain
- Designed automatic tax deduction system (TDS, PF, income tax) computed privately inside Intel TDX with three confidential transfers per employee
- Implemented encrypted payroll execution with single on-chain settlement transaction, ensuring zero financial data leakage on Solana Explorer
- Integrated role-based access using Permission Program, enabling selective data visibility for employer, employee, and auditors
- Developed real-time payroll processing (10ms blocks) with Magic Actions for automatic settlement and seamless UX
- Live Link: [Live Devnet](#)

Privacy Shield – ZK Biometric Identity Protocol [\[Link\]](#)

2026 ongoing

- Tech: Rust, Solidity, Circom 2.1, SnarkJS, Groth16, Poseidon Hash, foundry, MediaPipe, TensorFlow.js, Polygon Amoy, Sepolia Network
- Designed a privacy-preserving Sybil resistance protocol using Designated Verifier Proofs (DVP) for contextual unlinkability across dApps
- Built ZK circuits to generate per-application unique identities, preventing cross-application tracking and surveillance
- Implemented on-chain Groth16 verifier contract with wallet-bound proofs to prevent replay attacks
- Engineered client-side biometric processing with zero raw data storage and SNARK-friendly hashing for efficient proof generation
- Core innovation: Leveraged Designated Verifier Proofs (DVP) to prevent replay attacks

UMI (U and Me) – Peer-to-Peer Messaging System [\[Link\]](#)

May 2025

- Tech: Rust, libp2p, mDNS, Request/Response Protocol, TCP/IP
- Built a peer-to-peer messaging system without a central server using Rust and libp2p
- Implemented peer discovery and encrypted peer-to-peer communication over local Wi-Fi
- Tested messaging with multiple peers running concurrently on the same network
- Related Rust projects: SigByte (offchain/onchain signature verification) [\[Link\]](#), TelBot (Telegram automation bot) [\[Link\]](#)

SKILLS

Languages: Solidity (Advanced), Rust (Intermediate), JavaScript, Python, Java

Cryptography: Hash functions, Asymmetric and symmetric, RSA, Elliptic Curve Cryptography

Auditing Tools: Foundry (Fuzzing), Echidna (Basic), Slither, Aderyn

Blockchain Platforms: Ethereum (Solidity), Solana (Rust)

Core Concepts: DeFi, AMMs, Flash Loans, Oracle Manipulation, Lending

CS Core Concepts: Computer Networks, Computer Architecture, Compiler Design, Finite Automata, Data Structures, Discrete Mathematics

Development: Foundry, Hardhat, Remix IDE, Web3.js, Ethers.js, React.js, Node.js, MongoDB

ACHIEVEMENTS AND RESEARCH

- Ranked **#1** in Revert contest (**Top Finisher**) ([Cantina](#))
- Ranked **#2** in Intuition contest (**Top Gatherer**) ([Code4rena](#))
- Ranked **#1** QA report in Ekubo contest ([Code4rena](#))
- Ranked **#16** in Megapot contest ([Code4rena](#))
- Ranked **#20** in Kuru contest ([Cantina](#))
- Ranked **#98** globally among 843 teams in idekCTF 2025
- Active contributor to open-source security research; publishing audit reports and CTF write-ups on GitHub
- Deep focus on learning Rust and Anchor framework for Solana security auditing
